The aim is to increase the production speed of NFV products that will run on a cloud environment.

This will lead companies to migrate to cloud computing platforms faster.
Organisation Profile

- Established in 2011.
- Quickly expanded its customer-base with innovative solutions running in the cloud.
- Pronounced as a player in IDC Cloud Report 2012.
- In 2013 became the first platform enabling software vendors to distribute software via cloud technologies called PlusClouds Store. 3+ companies started selling software only on PlusClouds Store and 2 more invested on products that can only be sold on PlusClouds Store.
- Launched as a national player, now providing a cloud base for foreign companies from Spain, Netherlands, India and EMEA.

Dr. Barış Bulut, Enforma, baris@enforma-tr.com
✓ In cloud computing business one of the biggest challenges is maintaining distributed high speed networks.

✓ As the cost of high speed networks is high in contrast to cost of computing, NFV products running on mainstream x86-64 environment comes into play.

✓ Our ongoing approach is to develop NFV instances which can be used also in virtualised environment rather than instead of using mostly non-EU proprietary network appliances.
NFV producers are currently building their products on different Linux distributions (us too). Done cheaper. Now need to standardise for speed and reliability.

Once an NFV-suitable Linux distribution is out, many NFV providers will tend to adopt it to build their NFV products.

The proposed project will develop a standardised Linux distribution optimised for NFV to improve speed and robustness of end products based on NFV.

Will increase competitiveness of cloud computing companies.
Partners and Expertise

• Partners currently interested
  ✓ PlusClouds, TR
  ✓ Enforma, TR
  ✓ CStar, NL

• Missing partners / expertise
  ✓ Companies with networking and Linux expertise.
  ✓ Other SMEs (preferably with a start-up’s ambition) to accomplish this R&D.
